xforcekeygen3dsWin32 If Windows 8 fails to update DSI by default, you can enable using your device type (NAND, SSD, SD, etc…) which will enable you to write keystroke based recovery. To do this, create a recovery recovery image using WinPE 8 (or higher) and then copy the recovery image and the key file to your computer. After you've finished the process that will extract keystroke recovery, simply extract the file (and save it as keyfile) with .zip file.. Now, this is where your device has to be properly connected. You need to plug it into a graphics card. For Windows 7, Windows 7 x64 and Windows 8x you only need to plug the USB connector. For Windows 10 and higher you only need the HDMI or 3D-A connector as USB ports are not supported.. Step 4 – Extract the Keyfile When you want to extract the keyfile directly, go to Tools > Settings > Personalization > Security > Extract keyfile from a keychain. Select the keyfile.
